

API discovery and behavioral analytics security solution with response and automation

Digital transformation is driving the exponential increase in API rollouts, enabling organizations to remain relevant and accelerate their business with new revenue streams. But APIs are now a growing and significant attack surface that requires a different type of protection. APIs expose core business functionality by nature, their implementation is distributed and often not uniform, and CI/CD pipelines ensure they are in constant flux.

Neosec and Kong's partnership delivers a combined solution that is a first of its kind in protecting APIs. It brings together the Neosec ability to continuously discover APIs and its behavioral analytics approach to security with the ability to manage and automatically remediate and respond to threats in the Kong API Gateway.

API security challenges

Maintaining an API inventory
You cannot protect what you don't know about. Undiscovered, undocumented, or shadow APIs deployed by distributed teams are a problem for every organization.

Understanding your API risk posture
After discovering your API estate, knowing which ones pose the most risk is critical. Understanding which APIs transmit sensitive data is vital during any risk audit.

Protecting against OWASP API Top 10 vulnerabilities
Adequately protecting your APIs from vulnerabilities is difficult in ever changing agile organizations and traditional security techniques like signature matching are insufficient.

Detecting attacks from authenticated users
Business logic abuse, misuse of legitimate access, and account takeover often go undetected as traditional tools lack the context required for detecting API attacks.

Seeing behavior with business context
Without the correct tools, seeing all your API usage data over time and understanding the business context of abusive behavior is impossible.

Investigating and hunting API activity
Attempting to investigate API-related incidents, find indicators of compromise, or troubleshoot a user's problem requires retained data and the correct tools.

API management with API security

The joint solution from Kong and Neosec integrates the world's most popular API gateway with an enterprise class security platform that discovers all your APIs (not just those managed by Kong), and protects your APIs from business abuse and data theft.

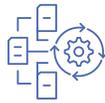

Understand behavior. Prevent threats.

Neosec is reinventing application security. Its pioneering SaaS platform gives security professionals visibility into behavior across their entire API estate. Built for enterprise organizations that expose APIs to partners, suppliers, and users. Neosec discovers all your APIs, analyzes their behavior, and stops attacks, abuse and misuse.

Discovery & Risk Audit

Discover your entire API estate without adding another sensor. Visibility into your API inventory is easy and takes minutes. Easily perform an audit to know which APIs are risky or vulnerable.

Behavioral Analytics & Context

The Neosec brain is an analytics engine that examines all your API usage data over time. Prevent abuse with context-aware security and see all activity on a timeline.

Investigations & Threat hunting

Powerful investigation capabilities allow you to understand risky behavior. Easily investigate alerts and hunt for threats hiding in your API traffic.

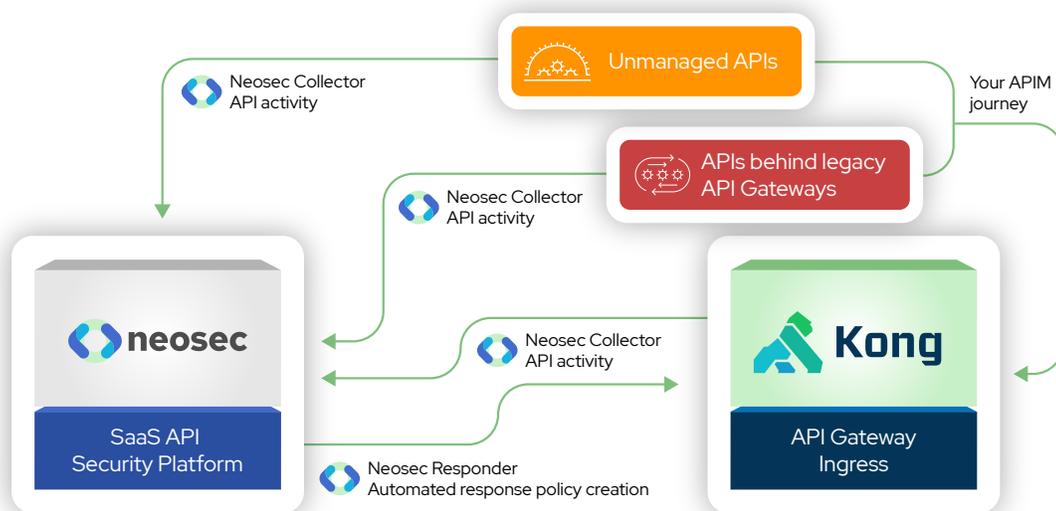

Response & Prevention

Create customized conditional response playbooks that improve your security and DevOps processes and work with your existing technology like Kong.

Kong + Neosec: A technology partnership for your API management journey

Neosec integrates out of band with almost any API activity data source. This enables you to get a clear and realistic view of your entire API estate, and provides you with the information you need to prioritize which APIs and services to migrate to Kong first.

Neosec is integrated into the Kong gateway with a simple installation using the standard TCP log plugin. The power of the integration is the ability to perform response automation actions in your Kong API gateway based on alerts created by Neosec. In a few clicks, you can create a response policy to automatically block or rate limit an alerted "consumer" entity for a period based on defined conditions. The integration also allows the creation of prevention rules for your Kong API gateway leveraging the rich AI/ML model outputs available for every user and business entity via the Neosec API.
